

THE INTERACTION BETWEEN HUMAN AND SPACE

my interpretation of architectural design

"For me, architectural design is about creating experiences through the interaction between human and space."

"It should create emotional experiences and connections by resonating with human frequencies, crafting spaces that adapt to and reflect human emotions."

"Different spaces emit different frequencies, influencing human emotions":

Room: Comfort, solitude, reflection.

Park: Freedom, peace, connection with nature.

Classroom: Focus, formality, curiosity.

Family Gathering Room: Warmth, belonging, nostalgia.

"Like human interactions,
these emotional experiences vary based on the space's frequency."

- "How does a space make a person feel?"
- "Can spaces also be affected by human presence, do they absorb our energies and emotions?"
- "How does human presence influence the space's frequency?"
- "Can a space's frequency be designed to adapt to different human energies?"

Why:

"To design spaces that resonate with human emotions and energies, creating a symbiotic relationship between human and space."

Architecture, therefore, should not be seen as a mere solution to spatial problems, but as a catalyst for emotional and experiential growth. It should constantly evolve to meet the needs of its users, not just in function, but in how it interacts with the human spirit.
